Known Issues

1. When enabling ZBI on a printer, the utility will look for feedback from the printer. If the utility cannot get data back from the printer, it will continue to attempt do retreive data until you click the "Cancel" button. This condition can happen if the RS-232 settings on the printer and PC are not synchonized, or if bi-directional communications are disabled on the printer.
2. Upgrading from version 2.07 or prior requires the user to deactivate any licenses before installing the new software, then re-activating the licenses after installation.
3. Administrator privileges are required to install the software.
4. DSS kit files that were built prior to the release of version 3.00 will need to be re-acquired, since they will no longer be correctly evaluated.
5. Version 2.09 may need to be manually uninstalled from windows.
